

Logic of all strategies

Abra Drowzee and Sudowoodo were based on the previous weeks. The new 3 stocks and 2 indices' logics are as follows:

1. Misty: Adapts based on volatility level.
 - If volatility is low, the trend tends to reverse to mean. With this info and support with RSI confirmation, the index is sold or bought.
 - If volatility is high, they code looks for breakouts beyond recent high/low.
2. Luxray : As the graph showed very jumpy trades, RSI and mean reversion were used but with greater intensity.
 - The trades are entered based on RSI and average price, but is more active.
 - If RSI is very far from 50, it trades bigger.
 - Since the trades fluctuate a lot, it aims to make quick profits.
3. Jolteon: Since the trades are about the mean but steep reversals, bigger trades and mean reversion is used.
 - Enter with bigger trades and only on very strong signals (RSI < 42 or > 58).
 - Trades less frequently but with more conviction.
4. Ash: the market changes behaviour and thus mean reversion using RSI is used.

- Buys/sells when price moves away from average and RSI supports the direction.
- Uses volatility to decide profit target and stop loss.

5. Shinx: the market is about mean but with very high fluctuations. The strategy used is basic mean reversion with RSI for this.

- Buys when the price falls well below average and RSI is low (oversold).
- Sells when price goes way above average and RSI is high (overbought).
- Exits when price comes back to average.
